Triumph Cafe Racer

I have a 2015 EFI Triumph Thruxton. This is what it looks like in stock condition. I would like to modify it into a cafe racer into something like this.

original

modified

current state

I've added clip-ons, moved the ignition switch, added fork gaitors and a different fender. I've swapped out the brake lever and master cyclinder to a brembo unit. I've also replaced the regulator/rectifier and relocated it to under the seat.

I would like some help on:

1. **Changing the angle of the tank**
2. **Building up the rear subframe by welding on a seat loop and making a custom seat.**
3. **Re-doing some of the electronics and relocate the battery under the new seat.**
4. **Weld on a tab for the rear reservoir.**
5. **Clean up the frame and powder coat it.**
6. **Create a new fender mounting system.**

Raise up the rear of the tank and build a box for the battery and fuse box so I can remove the plastic battery box on the side .

Fender mount
